

1. 44
54
44
2. Line 5
3. Lines 9,10,11 and 12
4. Yes,
Its scope is for $y = 9$
5. No
6. Yes
7. Lines 6 and 7
8. Yes, line 10 of the program has the actual value that gets passed in the function which is referred to as an argument.
9. Yes. When defining function, the placeholders usually in parentheses after the function name are called parameters. This program has it's parameters in line 5.
10. When the **pass statement** is executed, nothing happens, but you avoid getting an error when there are missing codes.
